

FOR IMMEDIATE RELEASE

ChemiGreen to introduce its latest invention, The Dock- Plug, at the Globe 2010 Exhibition in Vancouver

Toronto, Ontario – March 3rd 2010. ChemiGreen Inc., the developer and manufacturer of the WI-Plug Wireless Spill Containment System, will introduce its latest invention, The Dock Plug, at the Globe 2010 exhibition in Vancouver British Columbia, March 24th to 26th .

The Dock Plug is an automated multi-deployment system that is permanently installed in drains near loading docks. The Dock-Plug automatically activates once a truck moves into the loading dock. Once activated the Dock-Plug seals the drain completely thus prevents any potential chemical from entering the drain system should a spill occur during loading and unloading operations.

“After the successful launch of our unique Wireless Spill Containment System, the WI-Plug, we have received many requests for a multi-deployment system specifically for installation at the dock area” stated Mr. Shachar “Shak” Parran, ChemiGreen’s CEO, “our R&D team came up with a solution that is based on the original WI-Plug design and that will be welcomed by our customers”

The WI-Plug system is currently operational in Industrial facilities in Canada.

About ChemiGreen.

ChemiGreen Inc. is a Canadian company, and its main focus is on keeping spills on-site. ChemiGreen’s unique, world first Wireless Spill Containment System contains spills by blocking drains and outfalls during environmental emergencies, thus protecting the environment. The WI-Plug system commander is programmed to immediately send a signal to the wireless plug (WI-PLUG) to block the discharge from entering the drainage system.

The WI-PLUG immediately deploys, and contains the spill. At the same time the system commander will transmit an alarm to the plant’s Control Centre. Simultaneously, key-personnel are notified of the incident by e-mails.

The system turns an emergency into a routine clean-up.
